

SWT 22022 – Practical for
Internet Application
Development

Department of Information
and Communication
Technology
Faculty of Technology

Lab sheet :15
Reg. Number: SEU/IS/20/ICT/084
Academic Year :2020/2021
Date: 2024.10.24
Practical No :16

Title:

- HR Management System - II

Aims:

- Implement routes for views
- Implement views

Tasks:

- Update the APIs
- Update controller
- Create blade files

Activities :

1. Update the APIs

```
// For views
Route::get('employee', [EmployeeController::class, 'index']);
Route::get('employee/create', [EmployeeController::class, 'create']);
Route::get('employee/{id}/edit', [EmployeeController::class, 'edit']);
// For CRUD Operation
// Create
Route::post('employee/store', [EmployeeController::class, 'store']);
// Read
Route::get('employee/all', [EmployeeController::class, 'all']);
// Update
Route::post('employee/{id}', [EmployeeController::class, 'update']);
// Delete
Route::delete('employee/{id}', [EmployeeController::class, 'delete']);
```

```
11     return csrf_token();
12 });
13
14 // For views
15 Route::get('employee', [EmployeeController::class, 'index']);
16 Route::get('employee/create', [EmployeeController::class, 'create']);
17 Route::get('employee/{id}/edit', [EmployeeController::class, 'edit']);
18 // For CRUD Operation
19 // Create
20 Route::post('employee/store', [EmployeeController::class, 'store']);
21 // Read
22 Route::get('employee/all', [EmployeeController::class, 'all']);
23 // Update
24 Route::post('employee/{id}', [EmployeeController::class, 'update']);
25 // Delete
26 Route::delete('employee/{id}', [EmployeeController::class, 'delete']);
27
28
```

2. Update controller

```
<?php

namespace App\Http\Controllers;
use App\Http\Requests\StoreEmployeeRequest;
use App\Models\Employee;
use Illuminate\Http\Request;

class EmployeeController extends Controller
{
    public function index(){
        $employees = Employee::all();
        return view('employee.index', compact('employees'));
    }
    public function create(){
        return view('employee.create');
    }

    public function store(StoreEmployeeRequest $request)
    {
        Employee::create($request->validated());
        return redirect('employee')->with('success', 'Employee created
successfully.');
```

successfully.

```
    }
    public function edit($id)
    {
        $employee = Employee::findOrFail($id);
        return view('employee.edit', compact('employee'));
    }
    public function update(Request $request, $id){
        $employee = Employee::findOrFail($id);
        $employee->update($request->all());
        return redirect('employee')->with('success', 'Employee updated
successfully.');
```

successfully.

```
    }
    public function delete($id){
        $employee = Employee::findOrFail($id);
        $employee->delete();
        return redirect('employee')->with('success', 'Employee deleted
successfully.');
```

successfully.

```
    }
}
```

II. Create blade files

I. layout.blade.php

II. index.blade.php

III. create.blade.php

IV. edit.blade.php

layout.blade.php

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta http-equiv="X-UA-Compatible" content="ie=edge">
  <link
href="https://cdn.jsdelivr.net/npm/bootstrap@5.3.3/dist/css/bootstrap.min.css"
rel="stylesheet">
  <script
src="https://cdn.jsdelivr.net/npm/bootstrap@5.3.3/dist/js/bootstrap.bundle.min.js"
></script>
  <title>HR Management System</title>
</head>
<body>
  <div class="container">
    @yield('content')
  </div>
</body>
</html>
```

index.blade.php

```
@extends('employee.layout')

@section('content')
<div class="mt-5 card">
  <h2 class="card-header">Employee Details</h2>
  <div class="card-body">
    <table class="table table-bordered">
      <thead>
        <tr>
          <th>Name</th>
          <th>Role</th>
          <th>Salary</th>
          <th>Age</th>
          <th>Actions</th>
        </tr>
      </thead>
```

```

<tbody>
  @forelse ($employees as $employee)
  <tr>
    <td>{{ $employee->name }}</td>
    <td>{{ $employee->role }}</td>
    <td>{{ $employee->salary }}</td>
    <td>{{ $employee->age }}</td>
    <td>
      <a href="{{ url('employee/edit/' .
$employee->id) }}" class="btn btn-warning btn-sm">Edit</a>
    </td>
  </tr>
  @empty
  <tr>
    <td colspan="5">There are no employees.</td>
  </tr>
  @endforelse
</tbody>
</table>
</div>
</div>
@endsection

```

Name	Role	Salary	Age	Actions
Kalhara	Students	99999999.99	24	Edit
Kalhara	Students	99999999.99	24	Edit
Pasan	Lecher	100000.00	22	Edit
Githmal	Manager	100000.00	22	Edit

edit.blade.php

```

@extends('employee.layout')

@section('content')
<div class="mt-5 card">
  <h1 class="card-header">Edit Employee</h1>
  <div class="card-body">

```

```

        <form action="{{ url('employee/update/' . $employee->id) }}"
method="post">
    @csrf
    <div>
        <label for="name" class="form-label">Name</label>
        <input type="text" name="name" class="form-control"
id="name" value="{{ $employee->name }}" placeholder="Enter your name">
    </div>
    <div>
        <label for="role" class="form-label">Role</label>
        <input type="text" name="role" class="form-control"
id="role" value="{{ $employee->role }}" placeholder="Enter your role">
    </div>
    <div>
        <label for="salary" class="form-label">Salary</label>
        <input type="number" name="salary" class="form-control"
id="salary" value="{{ $employee->salary }}" placeholder="Enter your salary">
    </div>
    <div>
        <label for="age" class="form-label">Age</label>
        <input type="number" name="age" class="form-control"
id="age" value="{{ $employee->age }}" placeholder="Enter your age">
    </div>
    <button type="submit" class="mt-2 btn btn-
primary">Update</button>
    </form>
</div>
</div>
@endsection

```

Edit Employee

Name	Kalhara

id="role" placeholder="Enter your role">
            </div>
            <div>
                <label for="salary" class="form-label">Salary</label>
                <input type="number" name="salary" class="form-control"
id="salary" placeholder="Enter your salary">
            </div>
            <div>
                <label for="age" class="form-label">Age</label>
                <input type="number" name="age" class="form-control"
id="age" placeholder="Enter your age">
            </div>
            <button type="submit" class="mt-2 btn btn-success">Add</button>
        </form>
    </div>
</div>
@endsection

```

The screenshot displays a web browser window with the title 'HR Management System'. The address bar shows the URL '127.0.0.1:8000/employee/create'. The main content area features a form titled 'Add New Employee'. The form includes the following elements:

- Name:** A text input field with the placeholder 'Enter your name'.
- Role:** A text input field with the placeholder 'Enter your role'.
- Salary:** A number input field with the placeholder 'Enter your salary'.
- Age:** A number input field with the placeholder 'Enter your age'.
- Add:** A green button with the text 'Add'.

web.php

```
<?php

use Illuminate\Support\Facades\Route;
use App\Http\Controllers\EmployeeController;
Route::get('/', function () {
    return view('welcome');
});

Route::get('/token', function () {
    return csrf_token();
});

Route::get('employee', [EmployeeController::class, 'index']);
Route::get('employee/create', [EmployeeController::class, 'create']);
Route::post('employee/store', [EmployeeController::class, 'store']);
Route::get('employee/edit/{id}', [EmployeeController::class, 'edit']);
Route::post('employee/update/{id}', [EmployeeController::class, 'update']);
Route::delete('employee/delete/{id}', [EmployeeController::class, 'delete']);
```

EmployeeController.php

```
<?php

namespace App\Http\Controllers;

use App\Models\Employee;
use App\Http\Requests\StoreEmployeeRequest;
use Illuminate\Http\Request;

class EmployeeController extends Controller
{
    public function index()
    {
        $employees = Employee::all();
        return view('employee.index', compact('employees'));
    }

    public function create()
    {
        return view('employee.create');
    }
}
```

```

    public function store(StoreEmployeeRequest $request)
    {
        Employee::create($request->validated());
        return redirect('employee')->with('success', 'Employee created
successfully.');
```

```

    }

    public function edit($id)
    {
        $employee = Employee::findOrFail($id);
        return view('employee.edit', compact('employee'));
    }

    public function update(Request $request, $id)
    {
        $employee = Employee::findOrFail($id);
        $request->validate([
            'name' => 'required|string|max:255',
            'role' => 'required|string|max:255',
            'salary' => 'required|numeric|min:0',
            'age' => 'required|integer|min:18|max:65',
        ]);

        $employee->update($request->all());
        return redirect('employee')->with('success', 'Employee updated
successfully.');
```

```

    }

    public function delete($id)
    {
        $employee = Employee::findOrFail($id);
        $employee->delete();
        return redirect('employee')->with('success', 'Employee deleted
successfully.');
```

```

    }
}

```

StoreEmployeeRequest.php

```

<?php

namespace App\Http\Requests;

use Illuminate\Foundation\Http\FormRequest;

class StoreEmployeeRequest extends FormRequest
{

```

```
public function rules()
{
    return [
        'name' => 'required|string|max:255',
        'role' => 'required|string|max:255',
        'salary' => 'required|numeric|min:0',
        'age' => 'required|integer|min:18|max:65',
    ];
}
```

Discussion:

- In this lab session titled "**HR Management System - II**", we focused on enhancing our Laravel project by implementing new features and refining the existing structure. The primary goal was to establish seamless navigation through proper route definitions for various views, such as creating, listing, and editing employees. We concentrated on updating APIs to ensure they aligned with the application's requirements, which included revisiting controller logic for better CRUD operations. Additionally, we worked on creating and improving Blade files to provide an intuitive and functional user interface for tasks like adding, editing, and managing employees. This practical session emphasized integrating back-end and front-end functionality, which deepened my understanding of Laravel's routing, controller logic, and Blade templating, ultimately leading to a more robust and dynamic HR Management System.
