

Lab sheet 22**Submission Due: 11.11.2024****Title:** E – Commerce App - III**Aims:**

- Implement fully functioning application

Tasks:

- Install the Axios
- Use Axios

Activities:**React Project (Frontend)**

1. Install Axios using below command

npm install axios

2. Get token from backend and save within Axios header

```
const getToken = async () => {
  axios
    .get("http://localhost:8000/token")
    .then((response) => {
      const csrfToken = response.data;
      console.log(csrfToken);
      axios.defaults.headers.common["X-CSRF-TOKEN"] = csrfToken;
      axios.defaults.withCredentials = true;
    })
    .catch((error) => {
      console.error("Error fetching CSRF token:", error);
    });
};
```

3. Read data

```
const fetchData = async () => {
  try {
    const response = await
  axios.get("http://localhost:8000/product/all");
    setProductsData(response.data);
  } catch (error) {
    console.error(error);
  }
};
```

4. Save data

```
const addData = async (product) => {
  try {
    const response = await axios.post(
      "http://localhost:8000/product/store",
      product,
      {
        headers: {
          "Content-Type": "application/json",
        },
      }
    );
    console.log("Product added successfully:", response.data);
    fetchData();
  } catch (error) {
    console.error("Error adding product:", error);
  }
};
```

5. Update data

```
const updateData = async (product) => {
  try {
    const response = await axios.post(
      `http://localhost:8000/product/${product.id}`,
      product
    );
    console.log("Product updated successfully:", response.data);
    fetchData();
  } catch (error) {
    console.error("Error updating product:", error);
  }
};
```

6. Delete data

```
const handleDeleteProduct = async (product) => {
  try {
    const response = await axios.delete(
      `http://localhost:8000/product/${product.id}`
    );
    console.log("Product deleted successfully:", response.data);
    fetchData();
  } catch (error) {
    console.error("Error deleted product:", error);
  }
};
```

```
}  
}
```

Laravel Project (Backend)

1. Create new file within config named cors.php
2. Add following changes to the file

```
<?php  
  
return [  
    /*  
    |-----  
    | Cross-Origin Resource Sharing (CORS) Configuration  
    |-----  
    |  
    | Here you may configure the access control allowing all  
    | origins, methods,  
    | and headers. You may also specify specific origins or  
    | methods.  
    |  
    */  
  
    'paths' => ['api/*', 'product/*', '*'], // Add the paths you  
    want to allow  
    'allowed_methods' => ['*'],  
    'allowed_origins' => ['http://localhost:5173'], // Your React  
    app's URL  
    'allowed_origins_patterns' => [],  
    'allowed_headers' => ['*'],  
    'supports_credentials' => true,  
  
];
```

3. Publish cors using below code

php artisan vendor:publish --tag=cors
