

A thick dark blue vertical bar is positioned on the left side of the page. From its base, several thin, curved lines in shades of blue and grey sweep upwards and to the right, creating a dynamic, abstract design.

Practical No :01**

## **Title:**

- Introduction to PHP ( Hypertext Preprocessor ).

## **Aims:**

- Refresh the knowledge on basic of PHP with HTML.
- Understand the concepts of PHP.

## **Tasks:**

- Configure PC
- Basic Syntax of PHP
- PHP Comments
- PHP variable
- PHP Data Types
- PHP Constant

## **Activities**

### 1. Configure PC to work with Server-Side Programming (PHP).

#### I. Install XAMP server

- <https://www.apachefriends.org/download.html>
- Download an installer according to your operating system → Doubleclick the installer → Next → Next (Select the components) → Next (Select the location) → Next (Select Language ) → Next → Finish

#### II. Install Visual Studio Code

- <https://code.visualstudio.com/download>
- Download an installer according to your operating system → Doubleclick the installer → Accept the agreement → Next → Choose the location → Next → Next → Select additional tasks → Next → Install → Finish

## 2. Basic Syntax of PHP

```
<?php
    echo "Place your PHP script here";
?>
```

I. Create a new file and name it “**name.php**”.

II. Print your name only using echo function. III. Contain the script within html and run again.

**name.php**

```
<?php

    echo "My Name is Kalhara";

?>
```

## Output:

### 3. Comments in PHP

```
// single-line comment  
# single-line comment  
/* multi-line  
comment */
```

### 4. Variables in PHP

```
// Starting with $ sign  
$variable_name = "value";  
$num = 9;  
  
// Valid variable names  
$age = 23;  
$Name = "Olivia";  
$_country = "Sri Lanka";  
$best_friend_name = "Sofia";  
  
// Invalid variable names  
$5number = 5;  
$a#ge = 34;  
$no of people = 45;
```

- I. Create a new PHP file and name it “**greeting.php**”.
- II. Define three variables to store your friend's name, age, and weight.
- III. Display a greeting message to your friend. Ex:- “**Hello, Olivia. Have a nice day!**”.
- IV. Display your friend's age and weight on a new line.

### **greeting.php**

```
<?php
$name="Olivia";
$age=25;
$weight=6.1;

echo "Hello ".$name.". Have a nice day!. <br>";
echo "oliva age is : ".$age."<br>";
echo "oliva weight is : ".$weight."<br>";

?>
```

### **Output:**

## 5. Data Types in PHP

```
// String
$name = "John Doe";
// Integer
$age = 30;
// Float (Double)
$temperature = 20.10;
// Boolean
$isActive = true;
$isValid = false;
// Array
$customers = [];
// NULL
$emptyValue = null;
// Object
//Resource
```

- I. Create a new PHP file and name it “data\_types.php”
- II. Declare variables for customer name, product id, discount rate, is registered, shopping cart(empty array) , not found.
- III. Display the data type of above variables using var\_dump() function

data\_types.php

```
<?php
    $customer_name = "Pasan Kalhara";
    $product_id = 001;
    $discount_rate = 0.15;
    $is_registered = true;
    $shopping_cart = array();
```

```
$not_found = null;

var_dump($customer_name);
echo "<br>";
var_dump($product_id);
echo "<br>";
var_dump($discount_rate);
echo "<br>";
var_dump($is_registered);
echo "<br>";
var_dump($shopping_cart);
echo "<br>";
var_dump($not_found);
```

?>

## Output:

## 6. Constant in PHP

```
// define(name_of_the_constant, value_of_the_constant)
define("PI", 3.14159);
echo PI;
// const key word
const MAX_ATTEMPT = 3;
echo "<br>".MAX_ATTEMPT
```

**I. Create a new PHP file and name it “constant.php”.**

**II. Create a constant variable to store shipping cost.**

**III. Try to change the shipping cost after assign the value.**

### constant.php

```
<?php

define("SHIPPING_COST", 5.99);
echo "Initial Shipping Cost: " . SHIPPING_COST . "<br>";
const Updated_SHIPPING_COST =9.9;
echo "Updated Shipping Cost: " . SHIPPING_COST ;
?>
```

### Output:

## **Discussion:**

- **In this session, the goal is to refresh the basics of PHP and its integration with HTML while deepening our understanding of key PHP concepts. We start by configuring the PC for PHP development, ensuring that the necessary software like a web server (e.g., XAMPP) is set up. The focus then shifts to PHP's basic syntax, which is essential for writing proper PHP code within an HTML structure. We also explore the use of comments in PHP, a crucial practice for making code more readable and maintainable. The session further covers PHP variables, which store data values, and data types (such as strings, integers, arrays, etc.), which define the nature of the data being used. Lastly, PHP constants are introduced, which are like variables but hold values that cannot change. Understanding these fundamentals is key to writing efficient and clear PHP code.**
